

B24-T2-CT1 Bank data set variables description.

As mentioned in the assignment document, the dataset is related to : A leading bank runs marketing campaigns (like phone calls, emails, or messages) to offer financial products such as term deposits. However, reaching out to every potential client is expensive and time-consuming. Despite strong outreach, only a small percentage of customers accept the offer.

Since the data is marketing campaign related, we need to interpret the variables in that regard. Below is the brief description of the variables:

- Age : age of the client.
- Job : client's job type.
- marital: client's marital status.
- Education: client's highest level of education.
- Default: Whether the client has defaulted on a previous loan.
- Housing: Whether the client has a housing loan (mortgage).
- Loan: Whether the client has a personal loan
- contact: method of contact used to reach the client.
- month: The month when the client was last contacted. Used to see seasonal trends or something like that.
- day_of_week : The day of the week when the client was last contacted.
This is same as above but used to see certain days may be more effective for contacting clients (e.g., weekdays vs. weekends).
- duration: Duration of the last contact with the client, in seconds.
For example, may not always be true: Longer calls may indicate higher client engagement.
- day_of_week : The day of the week when the client was last contacted.
This is same like above but used to see certain days may be more effective for contacting clients (e.g., weekdays vs. weekends).
- Duration: Duration of the last contact with the client, in seconds.
Just to give you example may not be correct always longer call durations may indicate higher client engagement or interest (Note : May not be truer always)
- campaign: Number of contacts performed during this campaign for this client (including the current contact).
- Pdays : Number of days that passed by after the client was last contacted from a previous campaign. A value of negative one indicates that the client was not previously contacted. Positive values indicate how many days have elapsed since the last contact.
- Previous: Number of contacts performed before this campaign and for this client. Indicates how many times the client has been contacted in prior campaigns.
- Postoutcome : Outcome of the previous marketing campaign.
- emp.var.rate : Employment variation rate — the percentage change in the number of employed individuals in the country.

NOTE THIS IS JUST AN EXAMPLE: you can think like this A positive value indicates job creation, while a negative value indicates job losses.

- cons.price.idx : Consumer price index (CPI) —In economics this is a measure of the average change over time in the prices paid by consumers for a basket of goods and services.
Higher values suggest rising prices, which can affect purchasing power and consumer behavior.
- cons.conf.idx : Consumer Confidence Index (CCI) : is a crucial metric that reflects consumers' perceptions of the current and future economic conditions.
Higher values indicates that consumers are optimistic, which may lead to increased spending and economic growth.
- euribor3m : Euro Interbank Offered Rate (Euribor) for a 3-month period.
Represents the interest rate at which banks lend to each other in the eurozone.
- nr.employed : Number of employees — the total employment in the country.
- Y is basically target variable indicating whether the client subscribed to the term deposit (yes) or not (no). For this inly we are building model.
